
(a) a three-plan menu with required margins d_1, d_2, d_3
d_3
d_2
d_1
accepted by both
(some plan dominates)
rejected by both
s_1 (margin above floor 1)
s_2 (margin above floor 2)
(b) the witness menu {FAST, SLOW}: gap $= \mathcal{Q}$
$d_{\text{SLOW}} = (0, 2)$
$d_{\text{FAST}} = (2, 0)$
witness point (6/5, 6/5)
accepted by both
rejected by both
($s_1 + s_2 < 2$)
s_1 (margin above floor 1)
s_2 (margin above floor 2)
coordinate-wise acceptance $\bigcup_a (d_a + \mathbb{R}^n_+)$
acceptance gap (every weight licenses a plan; no plan dominates)
boundary of scalarized acceptance $\text{conv}(\mathcal{D}) + \mathbb{R}^n_+$
