

The index approves – but no plan keeps both floors safe

Two binding floors

each floor must hold
on its own

Weighted index

$$w \cdot s \geq 0$$

every weighting
approves

No common plan

s_1 (FAST)
 s_2 (SLOW)

each plan breaches
one floor

A reserve decides

$x < 1$

$x \geq 1$

the reserve bridges
the gap

Convexifying the plan menu closes the gap exactly; alternating plans over time does not.
