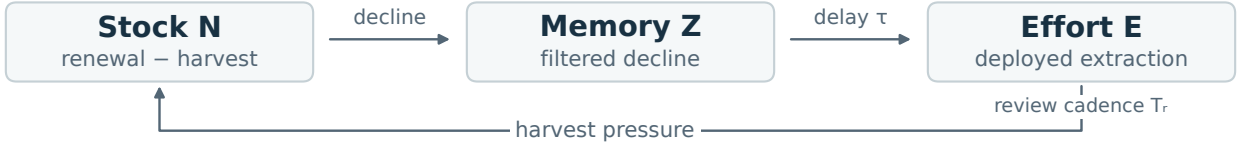
GOVERNANCE DELAY

Same stock. Different response laws.

Response law, deployment latency and review cadence are distinct design coordinates.



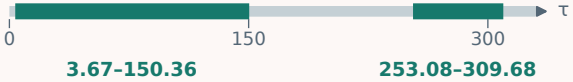
MOBILISING

Effort escalates with decline

Delay can stabilise — and destabilise.

Complete equilibrium root count, all positive delays.

A, gated · stable windows (years)



PROTECTIVE

Quota decreases as deficit memory rises

Complete interior basin

$E_0 < M$, $qE_0 < r$ and $\Gamma < 1$

Every fixed finite delay and positive fixed cadence

Native signal-hold / exact nonlinear quota review

$\Gamma < 0.475$
common point

$\Gamma < 0.687$
declared parameter box

Excluded: zero-stock and saturated-effort faces.

FIELD CHECK · NORTH SEA HERRING

Protective response: only 0.47% lower RMSE than AR(1).

Stock forecasts fail baselines; joint DDE validation is not achieved.

Continuum folds: rigorous full-series residual bounds ≠ an existence certificate.
