Journal of Industrial Ecology

Dear Editor,

Please consider the manuscript “**Typed material-flow ledgers for componentwise sustainability diagnostics**” for publication in the *Journal of Industrial Ecology*.

The manuscript develops a typed stock–flow framework for material-flow accounting in which substance classes, units, conversions, donor limitations and boundary flows are explicit. It establishes separate accounting, conservation and barrier-safety predicates; proves the obstruction to componentwise certification by a compensating scalar; and classifies groundwater anomaly persistence, phosphate reserve-life arithmetic and fisheries removals-only pressure time as distinct descriptive objects. The framework prevents throughput, economic reserve ratios or statistical indices from being promoted into unsupported physical depletion forecasts.

The submission is accompanied by two formally distinct related papers:

1. Abaee, A. (2026), *Certifying a Typed Ledger: The Predicates, the Programmes, the Vintages, and the Reproduction Bundle*. Methods companion: <https://doi.org/10.6084/m9.figshare.33942469>.
2. Abaee, A. (2026), *What the Accounts Settle, and What They Leave Open: Depletion as a Cost of Production, and the Missing Step from a Rate to a Horizon*. Standards commentary: <https://doi.org/10.6084/m9.figshare.33942487>.

The principal article record is available at <https://doi.org/10.6084/m9.figshare.33942451>. The three papers have distinct purposes: the submitted article presents the framework and applications, the methods paper specifies the certification and reproduction procedures, and the commentary addresses the accounting treatment of depletion and the interpretation of horizon claims.

This manuscript is original, is not under consideration elsewhere, and is submitted for exclusive consideration by the *Journal of Industrial Ecology*. The author declares no competing interests and no funding.

Thank you for your consideration.

Sincerely,

Amin Abaee
