Mesh study: the finite value converges to the continuous value from below
finite value $\rho(h) = 3/50 - Th/4$ (exact; solver agrees to $\leq 4.2 \times 10^{-17}$)
certified upper bound $\rho(h) + \bar{e} + Lh_t$, $h_t = h/2$ (Theorem 3.2(i))
continuous value $J(T) = 3/50$
a-priori halting resolution $h < 3/340$ (Theorem 3.2(iii))
