Pricing an observer: when does telling branch 1 apart restore viability?
eroded triple certificate $\Gamma(\tau_1)=\frac{3}{50}-\frac{3}{8}\left[(\frac{6}{5}-\tau_1)^2-1\right]$ (exact)
finite program ρ at $h=1/100$ (HiGHS; lower bound on J)
viable with the explicit schedule
certified nonviable
threshold $\tau_1^* \in [\frac{3}{25}, \frac{6-\sqrt{29}}{5}]$
certificate margin / finite value
